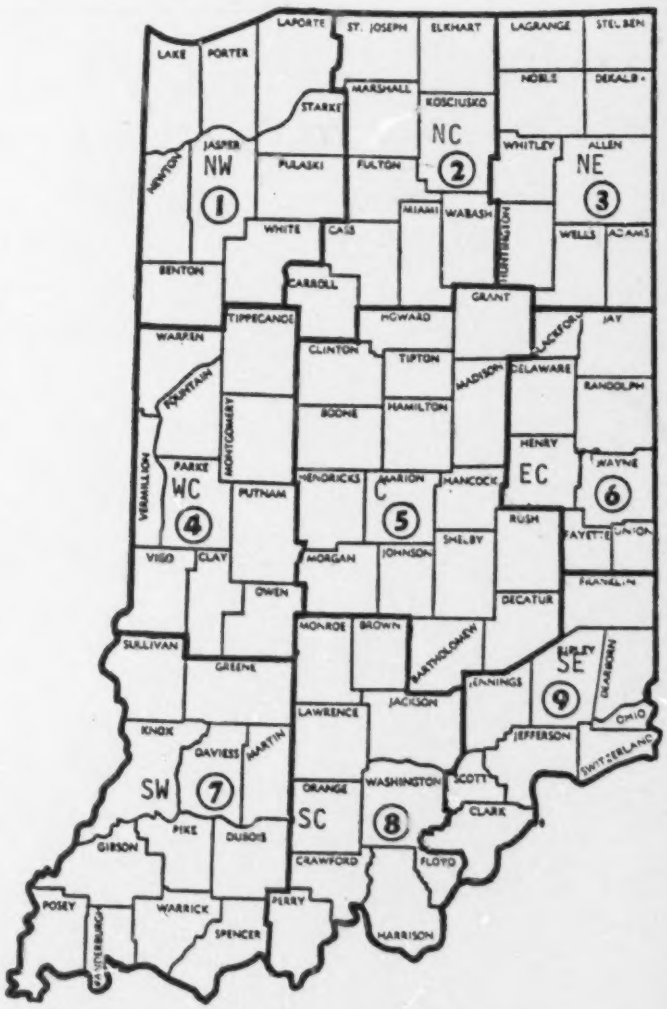
EARL L. PARK, *Agricultural Statistician In Charge*

For statistical purposes, the counties of Indiana are grouped into nine Crop Reporting Districts (shown on the map at right). These groupings represent divisions of approximately equal size with similar soils, growing conditions and types of farming.

Crop Reporting Districts are used in the compilation of most reports. It is not possible to collect sufficient data for each county to make county estimates on a timely basis. It is possible to summarize data at a district level and weight districts together by production percentages to arrive at the best State estimates.

Many data series in the bulletin present estimates for Crop Reporting Districts. Some series are further broken down into county estimates within districts.



Indiana Crop Reporting Districts

WEATHER IN INDIANA DURING 1982

A hard winter took its toll on wheat and some fruit crops in Indiana, while more favorable conditions existed for spring planted crops. Although spotty moisture shortages developed during the summer, crop growth and subsequent yields were generally good to excellent. A dry late September and October provided excellent drydown in the field and favorable harvest conditions.

In January and early February a series of intense winter storms moved across the midwest. January temperatures averaged ten degrees below normal in northern and central Indiana and six to eight degrees below normal in the south. Extreme lows between -15 and -25 were recorded in all sectors of the State. During a ten day period around mid-January, daytime highs moved above freezing only on a couple of occasions in the extreme south. Subzero and single digit lows occurred throughout the State nearly every day. The peach crop was lost as buds succumbed to periods of extreme cold that persisted through mid-February.

Milder weather dominated the State from mid-February through March, but a nearly continuous snow cover lasting into early March kept average temperatures well below normal in northern and central sections. Record spring floods occurred in the northeast sector of the State as snowmelt combined with above normal rain in March. Wheat in low areas suffered from ice and water damage, while higher fields with less snow cover were hurt by the extreme winter temperatures for western, central and southwest sections of Indiana.

Spring came slowly to Indiana. Record low temperatures were recorded during the first week and temperatures averaged 5 to 6 degrees below normal. Cool air and precipitation the first part of April kept fields wet. Field work accelerated in the last half of the month as warm, dry weather developed.

Spring plowing and corn planting caught up to normal by the first of May. A cold snap brought frost during the last week of April but by mid-May a sharp warm-up had taken place. The first 3 weeks of May brought excellent planting weather. Soil temperatures averaged in the lower 50's at the first of May then moved to average values in the upper 60's at mid-month, with daily maximums reaching around 80 degrees. The season's first 90 degree air temperatures were felt at this time. Conditions turned wet near the end of the month, delaying late planting operations, but temperatures remained above average. Average monthly temperatures were 4 to 6 degrees above normal, while rainfall was well above normal in the southeast and a little above elsewhere.

Corn was 90 percent planted by mid-May. Soybeans were well ahead of normal until rain delayed planting at the end of the month. Wheat conditions improved, but growth lagged behind average due to winter related injury.

A summer pattern of rainfall developed in June. Dry spots began to show up in the northwest and southeast, while near normal rains elsewhere maintained favorable germination and early growth. Niney-five percent of the corn had emerged by June 1. Rain delayed field work early in the month, and slowed the finish of soybean planting, but the crop was completely in by the normal third week. Frequent rains and cloud cover kept temperatures down until the last week. June temperatures were 4 to 5 degrees below normal over most of Indiana.

Warm and moist conditions boosted crop growth rates from the last week of June through July. Although insect problems were minimal, the wetness promoted lush weed growth and increased disease problems. July rainfall was above normal in the northwest and below normal in the southeast. Wheat harvest was complete by August 1, with reduced yields attributed to winter damage and disease problems. Oat harvest was complete by the second week of August.

A variable precipitation pattern in August left the northern third of the State dry while central and southern areas received above normal amounts. Corn was all silked and soybeans were in bloom by mid-month. Corn had all reached the dough stage by the last week, and soybeans had set pods by September 1. September was dry except for above normal rainfall in the northeast and south. Soil moisture was becoming short in the north but was excessive in the south. All corn was dented by mid-month, and both corn and soybean harvest was underway in the third week.

Ninety-five percent of the corn was safe from frost by the first week of October. Spotty frost occurred in north central and northeast areas on September 23, but the first general frost did not occur until October 17 for north and central areas and October 22 for the south. Excellent harvest weather persisted in October with 23 to 25 days available for field work. Unusually low relative humidities and mild daytime temperatures provided steady reduction of grain moisture in the field. Corn harvested at mid-September averaged 28 percent moisture. By October 1, moisture was 25 percent and had dropped to 20 percent by mid-month.

Ninety percent of soybeans were combined by the last week. Harvest moisture levels dropped from 15 percent in September to 13 percent during the last half of October.

The abnormally dry October was capped by widespread and locally heavy rains that developed over the final days. With most harvest activities ahead of normal, the moisture was welcome for dry topsoils. The new wheat crop was 95 percent seeded as the rains arrived.

--James E. Newman, Acting State Climatologist
John W. Kottke-Agricultural Meteorologist, National Weather Service, Midwest Ag-Weather Service Center, West Lafayette, Indiana

FOREWORD

This summary is the result of the continuing cooperation between the farmers and agribusinessmen of the State of Indiana, the Agricultural Experiment Station, Purdue University, and the Statistical Reporting Service of the U.S. Department of Agriculture. It provides the official estimates of agricultural production for 1982 together with comparison back to 1979. Included in this report are State estimates of acreage, yield, production, disposition, and other information related to crops; production and inventory numbers of livestock, including dairy and poultry; price and farm income data; labor and wage rates; and weather and crop progress data. County estimates for major crop and livestock items for 1982, 1981, and 1980 are also included. Historic State data from 1866 to 1979 and county crop estimates from 1923 through 1979 are also available upon request.

Farming is such an integral part of the national and world economy that it cannot function effectively without reliable information on which planning and marketing decisions can be based. To meet the needs of the farmers and others involved in agriculture, statistics are made available throughout the year in the form of weekly, monthly, and quarterly reports. The reports and approximate dates of release together with ordering instructions are shown on the inside back cover of this publication.

I wish to acknowledge the valuable assistance of the many Indiana farmers and operators of agribusinesses who voluntarily provide the raw data from which the official estimates are established. A special thanks is extended to the field enumerators, telephone enumerators, and to all members of the office who had a part in carrying out the surveys, evaluating the results, and establishing the estimates which are presented in this publication.

Earl L. Park
Statistician, In Charge

SC	5	8	22	62	104	153	171	164	124	71	26	8
SE	5	8	22	62	104	153	172	164	126	72	26	8

The above estimates of Growing Degree Days (GDD) Normals are derived from normal temperatures at mid-month and the corresponding GDD. Temperature and GDD relationship come from a computer run of 20 years (1949-1968) using Indianapolis data. For example, a weekly average temperature of 60° F. resulted in 84 GDD. The basic formula is: 1/2 (max. T. - 50) + 1/2 (min T. - 50) = GDD for one day. The maximum temperature is not allowed to exceed 86 degrees F. Negative units are not accumulated.

Acreage: The 1982 harvested acreage of the seven major field crops in Indiana totaled 13.3 million acres, an increase of less than one percent from 1981. A 5 percent increase to a new record high in acres of corn harvested for grain more than offset the negligible decline in soybean acres and a 20 percent decrease in wheat acres harvested. Corn acreage harvested at 6.32 million was only slightly higher than the earlier record of 6.30 million in 1976. The soybean acreage was second to the record high of 1981, off less than one percent. Greatest drop occurred in wheat acreage which was down 20 percent from the year before. Peppermint acreage, down 7 percent, was the only other crop showing an acreage reduction. Rye and spearmint held unchanged from 1981. Besides corn, other crops showing increases were oats up 12 percent; sorghum for grain up 8 percent; hay up 4 percent; tobacco up 4 percent; processing tomatoes up 19 percent; and potatoes up 13 percent.

Yields: With an excellent planting and growing season record high yields were set for corn, soybeans and hay. The corn yield of 129 bushels per acre was 17 bushels above the previous high set in 1979. Soybeans averaged 40 bushels per acre or 3 bushels above the previous record set in 1977. With an average yield of 3.06 tons per acre, hay exceeded the record of the preceding year by .19 tons per acre. At 17.5 tons per acre corn silage yield equaled the 1976 high. Wheat yield at 43 bushels per acre was the lowest since 1978.

Production: In 1982 both corn and soybeans set new records for production. The corn crop at 815 million bushels was 18 percent greater than in 1976 when the previous record was set. Soybean production at 183 million bushels exceeded the 1979 previous record by 15 percent. Indiana moved up to 3rd place in the U.S. production of corn compared with 5th place in 1981 but retained its 4th place ranking for soybeans. The wheat crop showed a 25 percent drop from 1981 as the result of lower yields and a 20 percent reduction in acreage.

THE 1982 CROP SEASON IN INDIANA

In final estimates for the 1982 season, Indiana's corn and soybean production were record highs. Corn production was 815 million bushels, up 25 percent from 1981, and 18 percent above the previous record of 693 million bushels set in 1976. Production was also up fractionally from the last forecast of 813 million bushels on November 1. Both the acres harvested and the yield were record highs. The acres harvested totaled 6.32 million, up 5 percent from 1981 and up only slightly from the earlier record of 6.30 million in 1976. Contributing most to the record production was the 129 bushel yield, 17 bushels above the previous high in 1979. The 1982 corn crop had a preliminary value of $1.8 billion, up 11 percent from 1981, even though the projected average price per bushel at $2.20 was 27 cents per bushel below a year earlier.

Soybean production was also a record high at 183 million bushels. This is up 21 percent from 1981 and 15 percent above the previous record of 159 million bushels produced in 1979. The exceptional production was the result of a record high 40 bushel per acre yield, 3 bushels above the previous record set in 1977. The harvested acres of 4.58 million was actually off fractionally from the record 4.60 million acres harvested in 1981. The projected value of the soybean crop was $989.3 million, up 7 percent, but the price per bushel at $5.40 dropped 68 cents from 1981.

Indiana's 1982 wheat crop was estimated at 46.4 million bushels, down 25 percent from the record high 1981 crop. The harvested acreage totaled 1.08 million acres, a 20 percent drop from the previous year. The yield of 43 bushels per acre was down 3 bushels from 1982. The value of the crop was expected to total $144.0 million, with an average value of $3.10, a 38 cent drop from 1981.

The 1982 hay production totaled 2.5 million tons, an 11 percent increase from the previous year. The yield of 3.06 tons per acre tops the previous record high of 2.87 tons set in 1981. The anticipated average price per ton was $63, a $6 decrease from the previous year. Of the total hay produced 59 percent was alfalfa and 41 percent was all other hay. Acreage of alfalfa at 385,000 was up 10,000 acres from 1981 and production totaled 1,463,000 tons. All other hay acreage was 430,000, up 20,000 acres, and production at 1,032,000 tons was up 9 percent.

Indiana's tobacco production in 1982 was 20.2 million pounds, the second highest in history topped only by the 24.9 million pounds produced in 1910. The tobacco yield averaged 2,350 pounds per acre, up from the 2,265 harvested in 1981. Acres harvested were 8,600, a 300 acre increase from the previous year. The value of production was $36.8 million, ranking tobacco as Indiana's fifth most valuable crop.

Apples ranked next in value with a 1982 production of 77 million pounds, an increase of 13 percent from 1981. The total value of utilized production was $10.4 million, a 12 percent increase from the previous year.

Ranking next in value was oats with a 1982 production of 6.1 million bushels, a 10 percent increase from the 1981 crop. The yield was 64 bushels per acre, a bushel lower than a year earlier. More than offsetting the lower yield was an increase in harvested acres. At 95,000, the oat acreage was up 12 percent.

The 1982 potato production in Indiana, at 1.3 million cwt., was up 51 percent from 1981. The yield of 258 cwt. per acre was an 11 year high. Acres harvested at 5,200 was up 13 percent. Potato prices were off sharply, averaging only $4.60 per cwt. compared with $6.45 in 1981.

Indiana's next most valuable crop was peppermint with a production of 378,000 pounds of oil, up 14 percent from the previous year. The 8,600 acres harvested were down 7 percent, but the yield of 44 pounds per acre was 8 pounds higher than in 1981. Spearmint production totaled 164,000 pounds, a 21 percent increase from the previous year. While the 4,000 acres harvested was unchanged from the previous year, the realized yield of 41 pounds of oil per acre was 7 pounds above 1981. The value of the peppermint crop was $4.7 million and the spearmint crop was $2.2 million.

Indiana's 1982 peach production was virtually nonexistent because of winter freeze damage.

Sorghum grain production totaled 949,000 bushels, a 5 year high and up 32 percent from 1981. The acreage for harvest at 13,000 was up 1,000 acres from the previous year, but accounting for most of the increased production was the 73 bushel per acre yield, 13 bushels more than in 1981. The average price per bushel was $2.02, an 8 cent drop from the previous year.

The estimated 1982 rye production totaled 260,000 bushels, an 11 percent increase from 1981. The yield of 26 bushels per acre was unchanged from the previous year, but the 10,000 acres harvested were up 1,000 acres. The average price per bushel was $3.20, off 30 cents from 1981.

Fruit Crop Summary

Indiana's total apple production of 77 million pounds for 1982 was up 13 percent from 1981. The price per pound remained unchanged at 13.8 cents per pound in 1982. Total value of the 1982 apple crop came to $10 million, up 12 percent from the year before and the highest on record.

Peach production in Indiana in 1982 was considered nonexistent because of the winter freeze.

2/ Estimates discontinued 1982.

Indiana Livestock Summary

The total inventory value of the four major species of livestock and poultry on Indiana farms January 1, 1983 (December 1, 1982 for swine and chickens) amounted to $1.133 billion--4 percent above a year earlier. The value for cattle, sheep, and chickens declined but were more than offset by a 25 percent increase in hog inventory value.

Cattle numbers were down 3 percent in 1982 and value per head dropped from $420 in 1982 to $415 on January 1, 1983. This resulted in a net decrease of 4 percent in total inventory value for cattle and calves. Cows and heifers that have calved totaled 650,000 head--3 percent below a year ago. Of this total 446,000 were beef cows (down 4 percent) and 204,000 were milk cows (down 1 percent).

Hog numbers increased 2 percent in 1982 and the average value per head increased from $76.50 in 1981 to $93.00 in 1982. This increased the total inventory value to $390.6 million as of December 1, 1982, 25 percent more than a year earlier.

Sheep producers had 14 percent fewer sheep than a year earlier which more than offset the increase in average value per head from $54.50 to $56.50. This resulted in a net decrease of 11 percent in the total inventory value of $6.7 million on January 1, 1983.

The total value of the chicken inventory was $30.5 million in 1982, down 1 percent from 1981. Total chicken inventory, at 23.5 million head, was 7 percent above last year, but value per bird dropped 10¢ from a year earlier to $1.30 as of December 1, 1982.

Hogs and Pigs

The total pig crop in 1982 was slightly below 1981 and was 3 percent below 1980. Sows farrowed in 1982 declined 1 percent from a year earlier but litter rate was up slightly. A 5 percent decrease in total pounds produced was offset by a 21 percent increase in price per hundredweight resulting in cash receipts 10 percent greater than in 1981. Gross income (cash receipts plus value of home consumption) increased 9 percent from a year earlier.

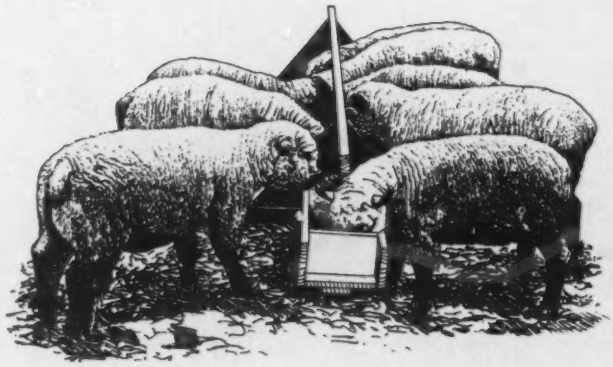
Sheep, Lamb and Wool Production

The number of sheep and lambs marketed in 1982 increased 11 percent from the 1981 total to 93,000 head and the pounds of sheep and lambs marketed increased 19 percent. The increase was the net result of a 9,000 head increase in marketings and a 7 pound increase in average liveweight of sheep and lambs marketed.



Lambs saved in 1982 decreased 8 percent from the previous year to 105,000 head. The number of ewes one year old and older on hand January 1, 1982 was down 12 percent from a year earlier which resulted in a lambing rate of 109 lambs per 100 ewes one year old or older. This compares with 120 lambs per 100 ewes in 1981.

Wool production declined 6 percent in 1982 to 852,000 pounds but was 6,000 pounds above the record low production in 1980. Sheep and lambs shorn totaled 124,000 head, 3 percent below a year earlier. The average fleece weight, at 6.9 pounds, compares with 7.1 in 1981. The average price of 39 cents per pound resulted in the lowest value of wool production on record at $332,000.

Wool Production and Value
Indiana 1979-1982

Year	Number of Sheep Shorn	Average Weight Per Fleece	Total Production	Price Per Pound	Total Value of Production
	Thousands	Pounds	Thousand Pounds	Cents	Thousand Dollars
1979	121	7.3	883	68 1/	600
1980	117	7.2	846	67 2/	567
1981	128	7.1	908	67 2/	608
1982	124	6.9	852	39 2/	332

1/ Average calendar year price.
2/ Monthly price weighted by monthly sales of wool.

3/ Includes receipts from marketings of farm slaughtered meat.

Poultry During 1982 in Indiana

Cash receipts from eggs totaling $208 million in 1982 were up 5 percent from a year earlier. The average number of layers at 17,713,000 was 3 percent greater than in 1981. The average rate of lay was up 1 percent to 252 eggs per layer, resulting in a 9 percent increase in total production. The average price per dozen eggs received by producers was 56.0 cents compared with 58.0 cents a year earlier.

1/ This color class includes Demi-Buff, Dark Brown, Violet, Pastel, Standard, and Pearl crosses and others.
2/ Included in "Other" to avoid disclosing individual operations.
3/ Includes color classes combined to avoid disclosing individual operations.
4/ Estimates discontinued July 1981. Reinstated 1982.

Farm Income and Prices

Indiana farmers received $4.6 billion in cash receipts from farm marketings in 1982, an 8 percent increase over 1981. Cash receipts from crops were up 12 percent from the year before; while receipts from livestock and livestock products were 3 percent higher. Marketing of crops, at $2.8 billion, accounted for 62 percent of the total cash receipts. Livestock receipts, at $1.8 billion, accounted for the remaining 38 percent. In 1981, crop receipts accounted for 60 percent and livestock 40 percent of total cash receipts.

Feed crops, of which corn is the major component, were the leading source of income for Indiana farmers amounting to $1.44 billion in 1982. Meat animals were second with $1.14 billion, while soybeans were third at $1.03 billion. Dairy products were the fourth leading contributor to farm income with $312.8 million and poultry and eggs, fifth, with $305.3 million. These five commodity groups account for 93 percent of the 1982 cash receipts.

Cash receipts for feed crops were up 24 percent from the previous year; soybeans were up 10 percent; meat animals were up 2 percent; dairy products up 1 percent; food grains down 35 percent; and poultry and eggs up 7 percent.

1/ Revised.

2/ Preliminary.

3/ Cucumber value included in Miscellaneous Vegetables.

4/ No significant commercial peach production in 1982 because of winter freeze damage.

5/ Starting in 1982, value for Popcorn, Red Clover Seed and Lespedeza Seed is included in the Other Field Crops category.

6/ Included in the Dairy Products total.

LIST OF AVAILABLE REPORTS

The Indiana Crop and Livestock Reporting Service publishes official estimates of crop and livestock production, prices received and paid by farmers, and various other special reports. The reports containing such data and the approximate date of release are shown in the following table. These reports are available by submitting a subscription notice together with the subscription fee to:

Crop Reporting Board Publications
Room 5829 South Building
U.S. Department of Agriculture
Washington, D.C. 20250

MAKE CHECKS OR MONEY ORDER PAYABLE TO: USDA-SRS

Name of Report	Frequency Of Reports	Annual Subscription Fee
INDIANA AGRICULTURE REPORT: A four page consolidated report issued at the first and the middle of each month bringing together the latest statistics on crop production including: crop reports, grain stocks, cropping practices, crop varieties, tobacco, fruit crops, and vegetable crops; and livestock statistics covering: hogs and pigs, cattle and calves, sheep and lambs, wool, livestock slaughter, dairy, and chickens and eggs. Also covered are: prices received and paid by farmers, number of farms and land in farms, land values, cash receipts, cold storage, and the Farmers-900-Newsline.	Semi-monthly	$10.00
WEATHER-CROP REPORT: A weekly progress report issued each Monday from April through November covering planting and harvesting activities, crop development, weather data, and timely crop management information.	Weekly	$12.00
COUNTY ESTIMATES: Issued each Spring, a county by county breakdown of harvested acres, yield and production for major crops and for livestock inventories.	Annual	$ 5.00

ANNUAL CROP AND LIVESTOCK SUMMARY
1982
Supplemental Data

Revisions in hog and pig numbers for 1982 could not be fully reflected in all tables at the time the Annual Crop and Livestock Summary went to the printer. The enclosed updated pages (76,79,86,87, and 89) relfect revisions made in the June 22, 1983 Hogs and Pigs Report.

Indiana Livestock Summary

The total inventory value of the four major species of livestock and poultry on Indiana farms January 1, 1983 (December 1, 1982 for swine and chickens) amounted to $1.133 billion--4 percent above a year earlier. The value for cattle, sheep, and chickens declined but were more than offset by a 25 percent increase in hog inventory value.

Cattle numbers were down 3 percent in 1982 and value per head dropped from $420 in 1982 to $415 on January 1, 1983. This resulted in a net decrease of 4 percent in total inventory value for cattle and calves. Cows and heifers that have calved totaled 650,000 head--3 percent below a year ago. Of this total 446,000 were beef cows (down 4 percent) and 204,000 were milk cows (down 1 percent).

Hog numbers increased 7 percent in 1982 and the average value per head increased from $76.50 in 1981 to $93.00 in 1982. This increased the total inventory value to $409.2 million as of December 1, 1982, 30 percent more than a year earlier.

Sheep producers had 14 percent fewer sheep than a year earlier which more than offset the increase in average value per head from $54.50 to $56.50. This resulted in a net decrease of 11 percent in the total inventory value of $6.7 million on January 1, 1983.

The total value of the chicken inventory was $30.5 million in 1982, down 1 percent from 1981. Total chicken inventory, at 23.5 million head, was 7 percent above last year, but value per bird dropped 10¢ from a year earlier to $1.30 as of December 1, 1982.
